SUMMARY

My experience combines a strong foundation in machine learning and deep learning concepts with hands-on work in building end-to-end AI and data-driven systems. I am comfortable moving from understanding algorithms to implementing, training, and evaluating models in practical settings.

EDUCATION

Ramakrishna Mission Residential College (Autonomous), Narendrapur, Kolkata
BSc (Honours) in Computer Science, 2022–25
CGPA –8.59

Ramakrishna Mission Vivekananda Educational & Research Institute, Belur
MSc in Data Science and Artificial Intelligence, 2025–27

SKILLS

- **Languages:** Python, C Programming, LaTeX
- **Frameworks:** NumPy, Pandas, PyTorch, Matplotlib
- **Operating Systems:** Windows, Ubuntu Linux
- **Tools:** Git/GitHub, MS Office

Internship

- **Development and Fine-Tuning of a Bengali Large Language Model for Question Answering and Text Generation**
Indian Statistical Institute (ISI), Kolkata 1st June 2026 – 31 July 2026

COURSE WORK

- Machine Learning, Artificial Intelligence, Deep Learning, Large Language Models and Blockchain
- Probability and Statistics, Linear Algebra, Time Series and Survival Analysis
- Distributed Computing, Data Structures and Algorithms

ACHIEVEMENTS

- **CUET-PG 2025 (Computer Science)** – Qualified
- **CUET-PG 2025 (Data Science and Artificial Intelligence)** – Qualified
- **VIT 2025 (Computer Science)** – Qualified with **62 Rank**
- **NIMCET 2025 (Computer Science)** – Qualified with **2018 Rank**
- **1st class 3rd Position in B.Sc Computer Science** from Ramakrishna Mission Residential College (Autonomous), Narendrapur, Kolkata

PROJECTS

Distributed Llama Inference System

RKMVERI

Feb 2026 – Apr 2026

This project, proposes a distributed inference framework where multiple connected systems collaboratively execute LLM inference using CPU parallelism over a Local Area Network (LAN). The system follows a Master–Worker architecture where a Root/Master Node coordinates multiple Worker Nodes to distribute computation tasks. This approach reduces memory load per machine, improves inference speed, and enables scalable local AI deployment without requiring costly GPU infrastructure.

AI-Powered Enterprise Log Intelligence System

RKMVERI

Feb 2026 – Apr 2026

An intelligent enterprise log analysis platform powered by Artificial Intelligence, Semantic Search, Retrieval-Augmented Generation (RAG), and Large Language Models (LLMs). The system performs semantic log retrieval, anomaly detection, automated root cause analysis, and intelligent incident reasoning for modern enterprise infrastructures.

Plant Disease Prediction using CNN Image Classifier

RKMVERI

Feb 2026 – Apr 2026

Plant diseases significantly reduce agricultural productivity and crop quality. The objective of this project is to build a deep learning–based image classification system capable of automatically identifying plant diseases from leaf images. The system uses Convolutional Neural Networks (CNNs) and hybrid deep learning architectures to classify healthy and diseased plant leaves across multiple categories.

Spam Email Detection

RKMVERI

Oct 2025 – Dec 2025

A Machine Learning and Natural Language Processing (NLP) based project for detecting whether an email/SMS message is Spam or Ham (Not Spam). This project applies various supervised machine learning algorithms along with TF-IDF feature extraction to build an efficient spam classifier.

Data Encryption through the encoding of high and moderate plaintext information blocks

RKMVERI

Feb 2025 – May 2025

An intelligent image encryption framework that combines machine learning with cryptographic techniques to achieve secure and computationally efficient data protection. The system classifies image blocks into high, moderate, and low-information categories using machine learning algorithms such as K-Means, SVM, Random Forest, and KNN based on features like entropy, contrast, energy, and homogeneity. Only the significant blocks are encrypted, reducing unnecessary computational overhead. The encryption process includes bit-plane extraction, chaotic map-based permutation, multiple S-box substitution, and XOR diffusion to ensure strong security and resistance against attacks. By integrating adaptive encryption with chaos-based cryptography, the proposed model improves encryption speed while maintaining confidentiality and integrity. The framework is particularly suitable for real-time and resource-constrained environments such as IoT, cloud systems, healthcare, and smart devices.
